

Nuclear In-Processing Xpress (NIX) provides in-depth workflow tracking that is both flexible and powerful. Workflow items are automatically created in the application or manually entered by the users of NIX. Workflow items can be assigned to specific individuals or groups of individuals to complete a task. Email notifications/pager messages can be configured to be sent out when a workflow item is created. Users of NIX are able to claim a workflow item that is assigned to their group to avoid multiple people working on the same issue. Examples of system generated workflow items are notifications of: a request ready for approval, an individual who is ready for badging, scheduling issues for a certain individual, a Personnel Access Data System (PADS) download returned negative results, termination of UA from another site in the fleet, lost badges, adjudication concurrence is required, expiration of UAA activities, and many more.
